Question / Problem:

When attempting to invoke the ImageProcessor constructor in our implementation, we are getting the following exception thrown:

Answer / Solution:

In the source code for Android the customer wrote:

```java
imageProcessor = new ImageProcessor();
```

and it failed with the reported error.

If you check the sample application ImageProcessor then you will see that you need to set the AppContextProvider before using the image processor like this:

```java
@Override
protected void onCreate(Bundle savedInstanceState) {
    // Initializing the SDK
    AppContextProvider.setContext(getApplicationContext());
}
```

Afterwards it was working.
