Kofax TotalAgility - Deploying the export connector configurations across different environments

Applies To

- Kofax TotalAgility 7.5
- Kofax TotalAgility 7.6
- Kofax TotalAgility 7.7

Scenario

When using an Export node in your process flow, we need to configure the documents export settings in the Kofax Export Connector utility separately. This can take some time to setup. It would be less than ideal having to setup the export connectors again when importing the package in a new environment.

Solution

KTA does include an option to include the export connector configurations in your package. This setting is called Connector Mappings.

In v7.5, this is found on the Process tab

In v7.6 & v7.7, this is found in the Export options tab
